Since the Industrial Revolution, Earth's climate has been changing fast. Human actions are the major factor promoting this intense pace. In particular, the massive use of fossil fuel (oil, charcoal, gas) releases a large amount of carbon dioxide (CO2) into the atmosphere, which concentrates, and warms the planet. So far, this climate change has not affected life on Earth too much.

The TRAPPIST-1 planets have been examined with ground and space telescopes. The space-based studies revealed not only their diameters, but the subtle gravitational influence these seven closely packed planets have upon each other; from this, scientists determined each planet's mass. So now we know their masses and their diameters.
